

# ESc101N: Fundamentals of computing(Lab Session 5)

August 31, 2009

## Instructions

1. Please read the question carefully and write the program accordingly
2. Make sure that the TA has graded you program
3. The marks are distributed as follows. You get 60% of the marks if the basic algorithm is current, 20% if you manage to compile and execute and 20% for writing the code cleanly, i.e. using proper variable names, intending and making the code more readable.

**Question 1.** (10 marks) Use an array to speed up printing the Pascals triangle mod 2. Recall that the Pascals triangle (mod 2) of height  $n$  consists of  $n + 1$  lines of integers 0 and 1 where for  $1 \leq r \leq \ell \leq n$ , the  $r + 1$ st integer in the  $\ell + 1$ st line is the value of  $\binom{\ell}{r} \bmod 2$ .

To calculate  $\binom{n}{r} \bmod 2$  make use of the formula

$$\binom{n}{r} = \binom{n-1}{r-1} + \binom{n-1}{r}.$$

Hint: Note that to compute the binomial coefficients  $\binom{m}{r}$  one needs only  $\binom{m-1}{r}$ s. Keep one array for  $\binom{m-1}{r}$  for different  $r$ 's and one for  $\binom{m}{r}$ 's for as  $m$  varies from 0 to  $n$ .

Sample output.

```

$ ./pascal
enter the height of the pascals triangle: 25
1
11

**Question 2.** (0 marks) (Not to be graded). Print the pascals traingle for large  $n$  on your xterm. Make the font of your terminal really small and make it full screen.
