Fundamentals of Computing: Lecture 4

Piyush P Kurur Office no: 224 Dept. of Comp. Sci. and Engg. IIT Kanpur

August 3, 2009

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Summary of previous lecture (Variables)

- Variables are memory location where values are stored
- They have a name, a type associated with them and a value.
- The name of a variable can start with a letter and contain letter or digit.
- The special character _ (under score) is considered as a letter.

The value associated can be changed using an assignment.

Summary Operator precedence

Arithmetic operators

- relational operators
- boolean operators

Summary Operator precedence

Arithmetic operators

Unary operators (unary -)

- ▶ *, /
- ▶ +, -
- relational operators
- boolean operators

Summary Operator precedence

Arithmetic operators

- Unary operators (unary -)
- ▶ *, /
- ► +, -
- relational operators
- boolean operators

eg - 4 * 3 < 1 & 2 > x + 5 is same as ((-4) * 3) < 1) & (2 > (x + 5))

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Integer expressions

Variable declaration

int x;
int foo=100;

Printing

printf("The value of integer variable %d\n",x);

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- Arithmetic operators +,-,*,/, %, (unary minus) etc
- Relational operators. <,<=,>, >=, == etc

Important

The operator for checking for equality is == and not =.

Factorial program

```
# include<stdio.h>
int main(){
 int n;
  int i = 1;
 printf("Enter the value: ");
  scanf("%d",&n);
  int fact = 1;
 while(i <= n)</pre>
  ł
    fact = fact * i;
    i = i + 1;
 }
 printf("The factorial of %d is %d\n", n, fact);
}
```

Why did the factorial program go wrong?

Why did the factorial program go wrong?

Answer

Integers are of fixed precision typically 32 bits.

Real numbers expressions

```
    Variable declaration
        float x;
        float pi=3.141;
        double avagadro = 6.023e23;

    Printing
```

```
printf("Values are %f, %g\n",x,avagadro);
```

 Arithmetic operators and relational operators are similar to integers.

Important

Use double always. That gives better precission.

Integers and Floats

C does automatic coversion between integers and floats.

- Integer to Float/Double extension
- Float/Double to integer truncation

Unfortunately this is a very bad design.

```
int u = 10;
int v = 11;
float av;
av = (u + v)/2
prinf("%f",av);
```

Assignments

Assignment is used to modify the value of a variable. eg.

(ロ)、(型)、(E)、(E)、 E) の(の)

x = 10; foo = 4.2;

Assignments

Assignment is used to modify the value of a variable. eg.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

x = 10; foo = 4.2;

Assignment as expression

In C assignment itself is an expression.

$$x = y = 10;$$

Assignments

Assignment is used to modify the value of a variable. eg.

x = 10; foo = 4.2;

Assignment as expression

In C assignment itself is an expression.

x = y = 10;

Special assignment

i++; i = i + 1; foo *= 10; foo = foo * 10;

Boolean

There are no booleans in C.

Integers, characters etc all play the role of boolean value of 0 is false. value of nonzero is true.

Boolean

There are no booleans in C.

Integers, characters etc all play the role of boolean value of 0 is false. value of nonzero is true.

WARNING

```
x = 100;
if (x = 0)
{
    printf("Null value unexpected");
}else{
    printf("Good value");
}
```
